Appendix A	9
Appendix B.....	10

1. Purpose

This document aims at providing a guide for using the Web Services provided by the ASAM Continuum™ application.

This document assumes you are familiar with core concepts such as:

- RESTful Services
- HTTP
- Certificates
- Json

2. Overview

The Continuum Integration API implements a set of RESTful Web Services for setting up the system from a remote application. They have been designed to allow for the broadest and easiest solution for integrating with any type of system.

These Services include:

- Creating a Patient
- Updating a Patient
- Getting a Patient
- Creating an Assessment
- Getting the raw Assessment Data
- Getting the Assessment Report

3. Integration

There are two parts to the ASAM software. One part is our WEB API and that is a set of RESTful services that return JSON or XML (the client determines the format).

Then we have the ASAM assessment applications which is a hosted web application. It is recommended to open a new browser or new tab in the current browser session when accessing the ASAM assessment application. Trying to implement with an IFrame will cause security issues and that is due to known security flaws with IFrame implementations.

4. Authentication

In order to access any of the web services an authorization token must be provided along with the request to verify the request is coming from a trusted system.

An authorization token really is a string containing a set of parameters describing the current user which has been digitally signed using a certificate. This is done exactly the same as described in the “ASAM Continuum Single Sign-On” document.

The main way to provide this token is by adding a header to the HTTP request. The name of the header must be “SSOAuth”.

If you are making a get request you can also provide the token as part of the Url Parameters i.e.:

`https://<server>/Patient/patient-1?UserId=user-1&UserName=Fred
Jones&Token=UGF0aWVudElkPXBhdGllbnQtMSZVc2VySWQ9dXNlci0xJlVzZXJOYW1lPUZyZWQgSm9u
ZXMmVXNlckVtYWlsPWZyZWQuam9uZXNAdGVzdC5jb20mVGltZXN0YW1wPTlwMDgtMTEtMDFUMT
k6MzU6MDAuMDAwMDAwMC0wNzowMA==`

See Appendix A for instructions on creating the token string.

5. Web Services

5.1. Create Patient

This service provides the ability to easily create a patient. This request must be an HTTPS POST request that contains the authentication token using the “SSOAuth” header. This service will respond with the Key for the newly created Patient.

Authentication Parameters:

Name	Description	Required
Ehrid	The Id of the EHR you are coming from	Yes
OrganizationId	The Id of the Organization you are coming from	Yes
User ID	The Id of the user who is requesting the resource.	Yes
UserName	The name of the user who is requesting the resource.	Yes
UserEmail	The email of the user who is requesting the resource.	No
Token	This is the digitally signed SHA-1 hash of the current message. See Appendix A for instructions on generating hash.	Yes

ServiceURL : `https://<server>/Api/Patient/`

Sample Json Content:

```
{  
  "Name": {  
    "FirstName": "Jane"  
    "LastName": "Doe"  
  },  
  "DateOfBirth": "1987-01-05T00:00:00",  
  "Gender": {
```

```

    "Code": "Female"
  }
}

```

Sample Json Response:

```

{
  "Key": "patient-1"
}

```

5.2. Update a patient

This service provides the ability to easily update a patient. This request must be an HTTPS PUT request that contains the authentication token using the “SSOAuth” header. This service will respond with the Key for the newly created Patient.

Authentication Parameters:

Name	Description	Required
Ehrid	The Id of the EHR you are coming from	Yes
OrganizationId	The Id of the Organization you are coming from	Yes
UserId	The Id of the user who is requesting the resource.	Yes
UserName	The name of the user who is requesting the resource.	Yes
UserEmail	The email of the user who is requesting the resource.	No
PatientId	Id of the patient.	Yes
Token	This is the digitally signed SHA-1 hash of the current message. See Appendix A for instructions on generating hash.	Yes

ServiceURL : <https://<server>/Api/Patient/>

Sample Json Content:

```

{
  "Key": "patient-1",
  "Name": {
    "FirstName": "Jane"
    "LastName": "Doe"
  },
  "DateOfBirth": "1987-01-05T00:00:00",
}

```

```

    "Gender": {
      "Code": "Female"
    }
  }
}

```

Sample Json Response:

```

{
  "Key": "patient-1"
}

```

5.3. Get Patient

This service provides the ability to retrieve a patient. This request must be an HTTPS GET request that contains the authentication token using the “SSOAuth” header or contains the authentication parameters as part of the url.

Authentication Parameters:

Name	Description	Required
EhrId	The Id of the EHR you are coming from	Yes
OrganizationId	The Id of the Organization you are coming from	Yes
UserId	The Id of the user who is requesting the resource.	Yes
UserName	The name of the user who is requesting the resource.	Yes
UserEmail	The email of the user who is requesting the resource.	No
PatientId	The Id of the patient.	Yes
Token	This is the digitally signed SHA-1 hash of the current message. See Appendix A for instructions on generating hash.	Yes

ServiceURL : https://<server>/Api/Patient/<patientId>

Sample Json Response:

```

{
  "Name": {
    "Prefix": "Mrs",
    "FirstName": "Jane",
    "MiddleName": "Anne,

```

```

        "LastName": "Doe",
        "Suffix": "Jr."
    },
    "DateOfBirth": "1987-01-05T00:00:00",
    "Gender": {
        "Code": "Female"
    },
    "Ethnicity": "Caucasian",
    "Religion": "Catholic",
    "Key": "patient-1"
}

```

5.4. Create Assessment

This service provides the ability to easily create an assessment for a patient. This request must be an HTTPS POST request that contains the authentication token using the “SSOAuth” header. This service will respond with the Key for the newly created Assessment.

Authentication Parameters:

Name	Description	Required
EhrId	The Id of the EHR you are coming from	Yes
OrganizationId	The Id of the Organization you are coming from	Yes
UserId	The Id of the user who is requesting the resource.	Yes
UserName	The name of the user who is requesting the resource.	Yes
UserEmail	The email of the user who is requesting the resource.	No
PatientId	The Id of the patient.	Yes
Token	This is the digitally signed SHA-1 hash of the current message. See Appendix A for instructions on generating hash.	Yes

ServiceURL : <https://<server>/Api/Assessment/<patientId>>

This post has no content.

Sample Json Response:

```

{
    "Key": "assessment-1"
}

```

5.5. Get Assessment Data

This service provides the ability to retrieve an assessments raw data. This request must be an HTTPS GET request that contains the authentication token using the “SSOAuth” header or contains the authentication parameters as part of the url.

Authentication Parameters:

Name	Description	Required
EhrId	The Id of the EHR you are coming from	Yes
OrganizationId	The Id of the Organization you are coming from	Yes
UserId	The Id of the user who is requesting the resource.	Yes
UserName	The name of the user who is requesting the resource.	Yes
UserEmail	The email of the user who is requesting the resource.	No
PatientId	The Id of the patient.	Yes
Token	This is the digitally signed SHA-1 hash of the current message. See Appendix A for instructions on generating hash.	Yes

ServiceURL : <https://<server>/Assessment/<assessmentId>>

Response will be Json data

See Appendix B.

5.6. Get Assessment Report

This service provides the ability to retrieve an assessments raw data. This request must be an HTTPS GET request that contains the authentication token using the “SSOAuth” header or contains the authentication parameters as part of the URL.

Authentication Parameters:

Name	Description	Required
EhrId	The Id of the EHR you are coming from	Yes
OrganizationId	The Id of the Organization you are coming from	Yes
UserId	The Id of the user who is requesting the resource.	Yes
UserName	The name of the user who is requesting the resource.	Yes

UserEmail	The email of the user who is requesting the resource.	No
PatientId	The Id of the patient.	Yes
Token	This is the digitally signed SHA-1 hash of the current message. See Appendix A for instructions on generating hash.	Yes

ServiceURL: https://<server>/Api/Assessment/<assessmentId> /Report

Response will be a PDF file.

Appendix A

The Token parameter is created by hashing the concatenation of the rest of the parameters and then digitally signing that hash and finally converting the signed bytes to a Base64 string. We require the SHA-1 algorithm for performing the hash.

The format of the concatenation of the parameters is “parameter-name=value” with an “&” in-between each parameter:

```
PatientId=patient-1&UserId=user-1&UserName=Fred
Jones&UserEmail=fred.jones@test.com
```

Then you would use that string as input to the SHA-1 algorithm to create the hash value of that string. And then you would sign that hash using a Certificate.

Here is example C# code for performing the hashing and digital signature using a certificate:

```
public static string SignWithCertificate(string text)
{
    // Open certificate store of current user
    var my = new X509Store(StoreName.My, StoreLocation.LocalMachine);
    my.Open(OpenFlags.ReadOnly);

    // Look for the certificate with specific subject
    var csp = my.Certificates.Cast<X509Certificate2>()
        .Where(cert => cert.Subject.Contains("CN=TrustedCert"))
        .Select(cert => (RSACryptoServiceProvider)cert.PrivateKey)
        .FirstOrDefault();

    // Hash the data
    var sha1 = new SHA1Managed();
    var data = Encoding.Unicode.GetBytes(text);
    var hash = sha1.ComputeHash(data);

    // Sign the hash
    var signedBytes = csp.SignHash(hash, CryptoConfig.MapNameToOID("SHA1"));
    return Convert.ToBase64String(signedBytes);
}
```

So the Authentication Header would look like:

```
UserId=user-1&UserName=Fred Jones&UserEmail=fred.jones@test.com& PatientId=patient-1
&Token=UGF0aWVudElkPXBhdGllbnQtMSZVc2VySWQ9dXNlci0xJlVzZXJOYW1lPUZyZWQgSm9uZ
XMmVXNlckVtYWlsPWZyZWQuam9uZXNAdGVzdC5jb20mVGltZXN0YW1wPTlwMDgtMTEtMDFU
MTk6MzU6MDAuMDAwMDAwMCAwNzowMA==
```

Appendix B

Assessment Data Json:

```
